

NATURAL GAS

Climate Change & the Value of Natural Gas Getting the Facts Straight

Pamela

Lacey – IGU Oct. 9, 2013

Overview

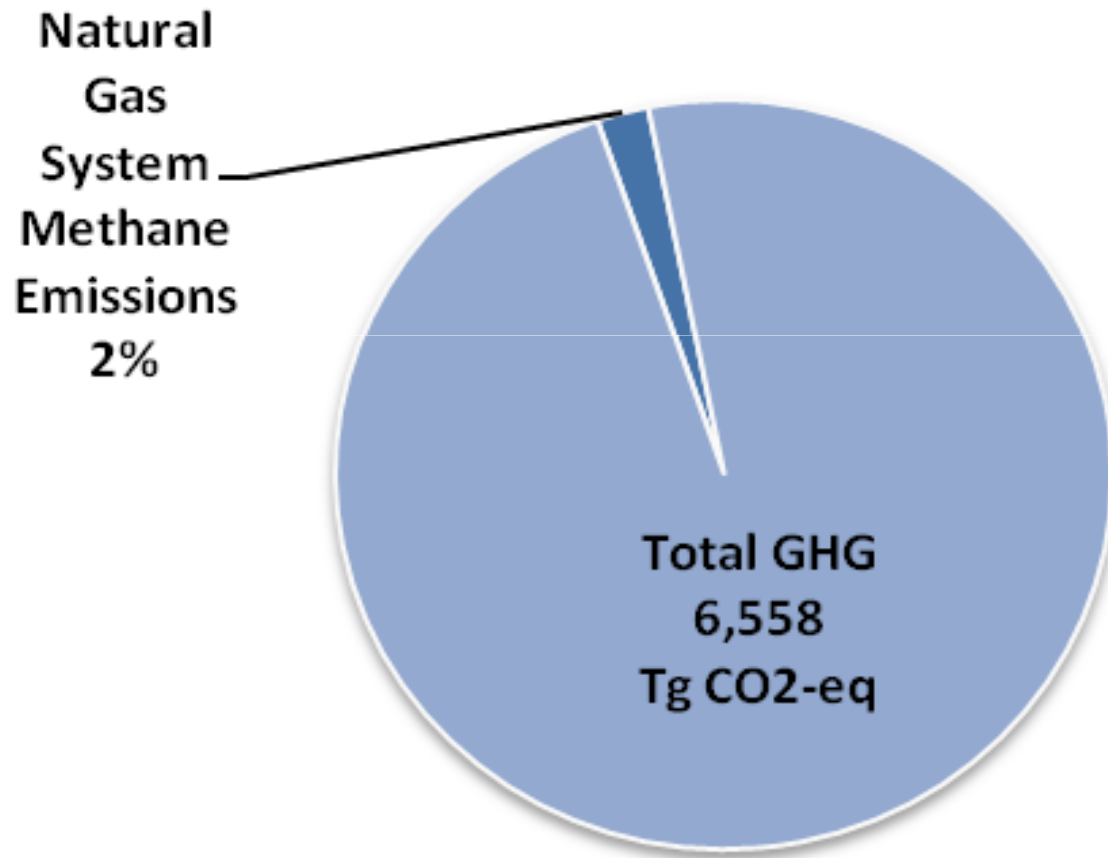

1. **Natural Gas Emissions:**
 - Carbon Footprint Overall
 - Distribution Context
2. **How Natural Gas Direct Use Can Help Reduce Greenhouse Gas Emissions**

I. Natural Gas – the cleanest fossil fuel

- **When combusted as a fuel, natural gas produces:**
 - **50% less CO₂ than coal**
 - **30% less CO₂ than oil**
 - **Significantly less Nitrogen Oxides**
 - **Virtually no Sulfur Dioxide**
 - **No mercury**
- **Natural gas is clearly the cleanest fossil fuel**
- **However, some argue that these low CO₂ emissions from combustion are offset by allegedly high emissions of natural gas from wells, pipelines and gas mains**
- **Are they correct? No.**

Natural gas systems represent a **small share** of annual GHGs

U.S. Methane Emissions Decline

(Million Metric Tons CO₂-eq.)

Technological advances, industry best practices and infrastructure investment... *add up to a declining emissions trend*

**Emissions from Natural Gas Systems
(Million Metric Tons CO₂-equivalent)**

Source: EPA GHG Inventory 2013

Natural Gas Distribution: Emissions Shrinking

- Emissions from distribution **shrank 16 percent** since 1990 ...
- even though we added almost **300,000 (30 percent more)** miles of distribution mains ...
- to serve **17 million (30 percent)** more customers
- Why? Because we replaced **thousands of miles** of existing cast iron and bare steel pipe with **modern PE plastic pipe**
- Result: EPA estimates distribution systems emitted **0.3%** of produced natural gas in 2011

EPA Inventory: New data has significantly revised emissions estimates downwards

**Natural Gas System Emissions
(Million Metric Tons of CO₂ Equivalent)**

Source: EPA GHG Inventory 2012/2013

Emissions Estimations Declining as they become more accurate

- **EPA 2012 Annual Inventory of U.S. Greenhouse Gas Emissions**
 - originally estimated **2.5% – 3.2%** of produced gas emitted in 2010 from well to customer.
- **New 2013 EPA Inventory**
 - only estimates **1.5%** of produced gas emitted in 2011 from well to customer, and of this,
 - only estimates **0.3%** of produced gas was emitted from gas distribution in 2011.
- EPA also found emissions from distribution have **declined over time** due to replacing cast iron and bare steel pipe.

EDF Field Studies - Natural Gas Emissions

1. **Production** –published Sept. 2013 – results similar to and confirm EPA Inventory
2. **Processing** – organizational phase; plan to publish later in 2014
3. **Transmission & Underground Storage** – beginning data collection
4. **Distribution** – finishing data collection; submit study for peer review fall 2013; publish 2014
5. **Pump to Wheels** – finishing data collection for natural gas vehicle fueling and exhaust; peer review fall 2013; publish 2014

II. Direct Use of Natural Gas

- **Using natural gas directly to heat space and water is better for the environment than using grid electricity**
- Why?
 - more energy efficient -
 - Use less natural gas for same number of hot showers and warm homes
 - Combusting less fuel = lower emissions

Consumers can save on their monthly utility bills through converting their households to natural gas.

Direct Use of Natural Gas Is the Clean, Efficient Choice

The direct use of natural gas in America's homes and businesses maintains about 92% of its usable energy, and a household with natural gas versus all-electric appliances produces 37% lower greenhouse gas emissions.

Converting natural gas or any other fossil fuel into electricity to power comparable electric end-use products and appliances only maintains 32% of usable energy.

Residential Water Heater Efficiency

Storage Water Heaters

**NATURAL
GAS**

\$548

Full-Fuel-Cycle Energy Consumption (annually)

26.5 MMBtu

49.7 MMBtu

CO₂ Emissions (annually)

1.5 tons

2.8 tons

Yet the federal minimum efficiency ratings for natural gas water heaters (40 gallons) (.62 EF) and electric water heaters (50 gallons) (.95 EF) are calculated at the point of use and do not take the full-fuel-cycle into account.

Extraordinarily Efficient

- America's natural gas delivery system is extraordinarily efficient with 92% of the natural gas produced at the wellhead being delivered to customers as usable energy.
- In typical home appliances, the direct use of natural gas results in energy consumption that is 28% less than a similar home with all-electric appliances.
- Natural gas water heaters are nearly 50% more efficient on a full-fuel-cycle energy comparison. Natural gas furnaces and boilers are up to 96% efficient.

“For appliances for which there is a choice of fuel, such as storage water heaters and heating equipment, efficiency ratings should be calculated using the extended site measure of energy consumption...”

Recommendation of the National Academies

Electricity

Natural Gas

Efficient Energy Use

Residential Energy Consumption

Expanding the direct use of natural gas in homes and businesses can reduce the energy lost in the generation and distribution of electricity.

Source: U.S. Department of Energy, Energy Information Administration

Residential Natural Gas Use: An Efficiency Success Story

Natural gas usage per household has decreased even as overall demand for energy has risen. This trend is due in part to installation of tighter-fitting windows and doors, better insulation, utility sponsored energy efficiency programs, and the development of increasingly more efficient natural gas appliances.

CONCLUSION

- **Natural gas emissions** from production wells, pipelines and distribution mains **are already low** – based on current estimates
- **Better data will provide a more accurate picture of the value chain’s “footprint” and demonstrate the true value of natural gas to fight global warming and improve the environment**
- **Natural gas can significantly reduce emissions from power plants** compared to coal fired plants
- But the **best use is “direct use”** of natural gas in homes, businesses and vehicles

ABOUT THE ANALYST

Rob Barnett, an energy analyst at Bloomberg Government, specializes in energy sector economics, environmental policy and strategy, and EPA regulations. Before joining Bloomberg, he was an associate director of Climate Change and Clean Energy at IHS Cambridge Energy Research Associates. At IHS CERA he led the environmental and energy analysis for various studies, including "Growth in the Canadian Oil Sands: Finding the New Balance," and "Crossing the Divide: The Future of Clean Energy." Before that, Barnett worked for Clemson's Power Quality and Industrial Applications Laboratory, where he modeled electric power systems to assess the impact of distributed generation.

Barnett holds a master's degree in economics from Boston University and undergraduate and master's degrees in electrical engineering from Clemson University.

Communicating Advocacy Priorities

AGA
American Gas
Association

Delivering natural gas that fuels America's way of life

- The American Gas Association , founded in 1918, represents local natural gas companies that cleanly fuel the way of life of 177 million Americans nationwide
- 2.4 million miles of pipeline
- 90 million therms of natural gas delivered annually accounts for 40% of the total U.S. natural gas consumption

Sources: AGA Gas Facts; U.S. Census Bureau American Housing Survey; U.S. Department of Transportation

OUR ROLE IN POLICY

Delivering on America's National Priorities

- National energy policies should help:
 - improve energy efficiency
 - ensure energy affordability
 - reduce greenhouse gas emissions
 - increase America's energy security and support American jobs
 - create a level playing field

INDUSTRY ISSUES

Advocacy Priorities

- Pipeline Safety
- Fiscal and Tax
- Recognition of the benefits of natural gas in energy policy
- Natural Gas Supply
- Infrastructure: Cybersecurity
- LIHEAP
- Efficient Natural Gas Solutions
- Natural Gas as a Foundation Fuel

They have plenty of energy for the future. Fortunately, so do we.

Did you know that the U.S. has enough domestic natural gas to meet America's diverse energy needs for nearly 100 years? Or that natural gas offers tremendous value, having saved residential consumers \$35 billion over the past three years? Natural gas is clean, affordable, and — most importantly — it's an abundant, domestic resource for our country. And it's one that's safe, reliable and can improve our environment while enhancing energy security. Natural gas fuels more than 70 million American homes and businesses. Learn more at aga.org.
